

HIGHWALL STABILITY

BEST PRACTICES

1. Train all employees in highwall hazard recognition.
2. Conduct examinations prior to beginning work around highwalls, and as frequent as necessary to ensure safety, especially during periods of changing weather conditions. Inspect the top and bottom of the highwall for cracking, spalling, sloughage, loose ground, and large rocks that could be hazardous.
3. Communicate changes in mining methods or blasting issues to oncoming shifts.
4. Ensure loose material is scaled prior to performing work. To safely scale using the shovel, maintain the highwall height within the reach of the bucket.
5. Position the shovel and trucks so that the shovel cab swings away from the highwall when loading.
